Pain Medicine Consultation

Date: 08/18/2026 Patient: Victor Hale, age 64

History

Failed back surgery syndrome after L4-L5 fusion in 2022. Chronic intractable low back and leg pain for 3 years. Pain is neuropathic, radiating down the left leg. Average pain NRS 8/10.

Conservative treatment tried

Gabapentin and duloxetine for over 12 months, physical therapy 24 visits in 2025, two epidural steroid injections and a medial branch block, and 8 sessions of pain psychology (CBT for chronic pain). None gave lasting relief.

Screening

Evaluated by our multidisciplinary team: pain medicine (history and full physical and neurologic exam), physical therapy, and a psychological evaluation by Dr. Paul Grant, PhD (report attached). MRI reviewed: no new surgical lesion.

Substance use

No current or past substance use disorder. Urine drug screen 8/18/26 consistent with prescribed medicines only.

Education

We had an extensive discussion of the risks and benefits of spinal cord stimulation, the trial, the permanent implant and the alternatives. Written materials given. Patient understands and wants to proceed.

Plan

Spinal cord stimulator trial, then a permanent implant if the trial is positive. The permanent implant will be done in: Physician office procedure suite, Lakeview Pain and Spine Center.

Psychological Evaluation - Pre-SCS

Date: 08/26/2026 Patient: Victor Hale Evaluator: Dr. Paul Grant, PhD, Clinical Psychologist

Psychological screening for spinal cord stimulation completed: clinical interview, PHQ-9 (6, mild), GAD-7 (4), Pain Catastrophizing Scale (18).

No untreated major depression, psychosis or cognitive impairment. Realistic expectations of the therapy. No current or past substance use disorder.

Conclusion

Psychologically cleared to proceed with a spinal cord stimulator trial and implant.

Spinal Cord Stimulator Trial Report

Trial dates: 09/14/2026 to 09/21/2026 (7 days) Patient: Victor Hale Member ID MBR-43007

Trial

Percutaneous trial with two temporary epidural leads at T8 to T10, placed in the hospital outpatient department. This was the patient's first spinal cord stimulator trial. No prior SCS trials in any spinal region.

Pain

Target pain NRS 8/10 before the trial and 3/10 during the trial: a 63% reduction in target pain.

Medication

Oxycodone reduced from 30 mg a day before the trial to 10 mg a day during the trial (a 67% reduction).

Function

Functional improvement: walking tolerance went from 2 blocks to 1 mile, sitting from 20 minutes to 1 hour, and sleep from 4 to 7 hours.

Result

Positive trial. The patient experienced a clear positive response and wants to proceed to the permanent implant.

Meera Iyer MD 9/22/26
