Psychiatric Evaluation

Date: 09/18/2026 Patient: Lorraine Pierce, age 53 Evaluated by Dr. Daniel Kim, MD, Psychiatry

Dx: Major depressive disorder, recurrent, severe, without psychotic features. PHQ-9 23, HAM-D 27. Current episode 14 months. No psychosis, no mania. No alcohol or substance use disorder.

Medication trials this episode, 2 different classes, each at an adequate dose and duration: sertraline (SSRI) up to 200 mg daily x 10 wks, no clinically significant response. Bupropion XL (NDRI) 300 mg daily x 8 wks, no response.

Psychotherapy: 16 sessions of CBT, no significant improvement (records attached).

Safety: no history of seizures or epilepsy. No psychotic symptoms. No stroke, dementia, head trauma or CNS tumor. No pacemaker, ICD, cochlear implant, VNS, aneurysm clips, stents or other metal in the head or neck. Dental fillings only.

Plan: I examined the patient and reviewed the full record. Because of her severe comorbid anxiety and chronic migraine, I order RIGHT prefrontal low-frequency (1 HZ) rTMS, 36 sessions, not left-sided high-frequency stimulation. I am experienced in TMS and will directly supervise every treatment.
